

PARTICIPATE IN VITAL RESEARCH TO HELP CHILDREN WITH FETAL ALCOHOL SPECTRUM DISORDER (FASD)

Are you the caregiver of a child with FASD?

WE NEED YOUR HELP!

Researchers at the Child Health Research Centre are doing a study to assess health outcomes of children with fetal alcohol spectrum disorder (FASD). We are looking to gather information from Australian caregivers who have children with FASD (aged 5-18 years).

Most of the research so far has investigated the impacts of prenatal alcohol exposure on the developing brain, but there has been very little research about how prenatal alcohol exposure could affect the development of the rest of the body.

With your help, our study hopes to fill in the gaps and learn more about how Australian children have been impacted by prenatal alcohol exposure. Ultimately, this will help to develop interventions to improve the health and wellbeing of individuals with FASD.

WHO CAN BE IN THE STUDY?

Australian caregivers of children with FASD (aged 5-18 years)

WHAT IS REQUIRED?

Complete an online survey (approx. 30 mins duration) that will ask you questions about your child's past and current health.

Caregivers who live locally to South Brisbane may have the opportunity to participate in a range of non-invasive assessments of health and wellbeing (eg. Blood pressure, kidney ultrasound, body composition). Please let us know if you are interested in being involved.

HOW DO I COMPLETE THE SURVEY?
