

Are you the caregiver of a typically developing child aged between 6-17 years?

We need your help!

Researchers at the Child Health Research Centre are doing a study to assess health outcomes of children with fetal alcohol spectrum disorder (FASD). As a comparison, we are looking to gather information from Australian caregivers and typically developing children.

With your help, our study hopes to fill in the gaps and learn more about how Australian children have been impacted by prenatal alcohol exposure. Ultimately, this will help to develop interventions to improve the health and wellbeing of individuals with FASD and their families.

Who can be in the study?

Australian caregivers and their typically developing children (aged 6-17 years).

What is required?

Children will participate in a range of non-invasive assessments of their health and wellbeing. For example,

this will include collecting your child's blood pressure, body composition using the Bodpod, and a brief number of cognitive measures. A brief summary report will be provided of the assessment results.

Caregivers will be required to complete a questionnaire asking about your child's health and wellbeing. For example, including questions about their sleep, eating, exercise, and behavior.

Where is the location?

62 Graham St South Brisbane (right near South Bank). We can provide free on-site parking.
