

Traumatic and Acquired Brain Injury research in children and adolescents

Would you like to be involved in research looking at health care services available to your child for their condition?

The study will explore the needs and services required by children with ABI in QLD by looking at:

- Health care services available and used by children and families
- How accessible these services are based on where they live and their circumstances

What's involved?

- Two telephone interviews (at times that are most convenient for you) and to get your permission to access some background medical information. Your interview findings will be kept completely confidential.
- Some questionnaires will be sent to you to fill out in your own time.

Who is doing the research?

The Acquired Brain Injury in Children (ABiC) research group is led by Associate Professor Karen Barlow, who is a paediatric neurologist and the Chair for Paediatric Rehabilitation in Acquired Brain Injury. This research group is part of The University of Queensland Child Health Research Centre

If you would like to be involved or have any questions, please contact:
